WavLM-Large for Parkinson's Speech Classification

Proposal Experiment: Verified Speaker-disjoint OOF Evaluation

Arannamoy Mondal

14 October 2026 Report 1.0 Experiment v4.0

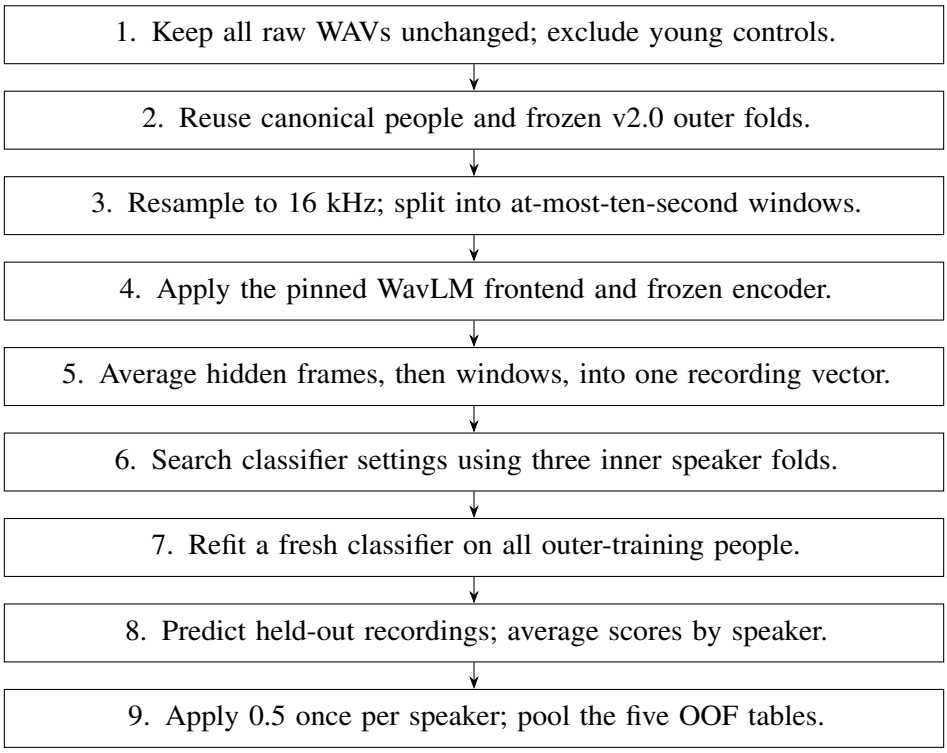

Abstract

This separate experiment implements the WavLM-based proposal using the latest PatchTST technical report's evidence structure. It asks whether Random Forest or XGBoost improves on logistic regression when all three receive exactly the same frozen WavLM-large recording embeddings, speech tasks and speaker folds. It uses 773 recordings from 46 canonical people, 25 with Parkinson's disease and 21 elderly controls. It does not replace the official v2.0 PatchTST result. The frozen logistic baseline has pooled speaker F1 97.96%, recall 96.00%, specificity 100.00%, precision 100.00%, and accuracy 97.83%. All comparisons are revised internal evaluations on a previously studied corpus. Speaker separation and training-side selection are checked, but recording-condition confounding and external clinical generalization remain unresolved.

1 One question, one input, three matched classifiers

The input is a 1,024-value representation of each recording, extracted by a pinned, frozen WavLM-large encoder. Logistic regression is the predeclared baseline; Random Forest and XGBoost are extensions, not replacements chosen after looking at a test score. All three use the same cohort, tasks, outer folds, inner splits, training weights and threshold. The question concerns corpus-label classification, not a new clinical diagnosis.

2 The whole pipeline

Fixed feature extraction learns nothing from this corpus. Classifier fitting, scaling, parameter selection and the optional fine-tuning decision remain inside training people. Every number reported below is generated from saved predictions.

3 The recordings and canonical people

The unmodified corpus contains 831 WAV files. Removing 45 young-control files leaves an eligible 786-recording index with 47 working person identities. Known repeat sessions for Vito S, Nicola S and Roberto R are linked before splitting. The study deliberately retains the latest report's common cohort: 773 files and 46 people. Vitantonio D lacks passage recordings and remains excluded from that shared cohort. This is a design choice, not a requirement of WavLM itself. Age, sex, CPS, native sample rate, dates, names, tasks and paths are metadata; none is appended to the classifier feature vector. Task names only describe errors. Young controls remain outside both training and reported evaluation. The native-rate sensitivity experiment retains 613 recordings from 39 people: 18 patients and 21 controls. It is retrained separately using only recordings originally sampled at 16 kHz. Three flagged controls are removed only in the separate main-OOF sensitivity evaluation; those models are not retrained.

4 From waveform to WavLM representation

Mono PCM is read as float32 and resampled to 16 kHz with librosa's soxr_hq. No extra peak normalization, task trimming or metadata-derived feature is applied. The pinned pretrained frontend then performs its standard mean/variance normalization within each waveform window. This is not peak normalization, but it removes absolute waveform level cues, including some potential voice-level and recording-gain information. It differs from the level-preserving PatchTST input. Windows cover at most ten seconds. Long recordings use consecutive ten-second windows, plus a final overlapping full window when needed to cover the tail. Short recordings remain short; only inputs below the convolutional minimum of 400 samples are edge-padded. A ten-second window produces 499 hidden frames.

$$e_{jk} = \frac{1}{T_{jk}} \sum_{t} h_{jkt} \in \mathbb{R}^{1024}, \qquad e_j = \frac{1}{K_j} \sum_{k} e_{jk}.$$

The encoder has 315,453,120 parameters, all frozen during this extraction. It has 24 transformer layers, 1,024 hidden values and 16 attention heads. It is a pretrained speech representation, not 1,024 hand-crafted measurements. Revision: `c1423ed94bb01d80a3f5ce5bc39f6026a0f4828c`. The exact checkpoint, frontend and configuration files are fingerprinted. WavLM was pretrained for general speech representation; Italian-corpus success does not demonstrate language-independent or clinical generalization.

5 What each classifier learns

Logistic regression: a training-fitted weighted standard scaler followed by regularized linear classification. C is selected from 0.01, 0.1, 1 and 10. **Random Forest:** 300 trees; depths 4 or unrestricted; minimum leaves 1 or 2; square-root feature subsampling. No learned scaler is required. **XGBoost:** 200 histogram-based boosting rounds; depths 1, 2 or 3; learning rates 0.03 or 0.1; half of embedding columns considered per tree; L2 regularization 1. These six settings are predeclared. The grids contain 4, 4 and 6 candidates respectively. The first candidate in the frozen grid order wins exact validation-score ties. There is no outer-test early stopping, threshold search, feature selection or best-fold selection. Feature values must be finite. Invalid cache files stop the run rather than silently being imputed or dropped.

6 Nested speaker folds and final refit

The five outer folds are exactly those of v2.0. Each held-out person receives a prediction from a model trained without that person. Repeat sessions and all recordings from a person stay together. Inside each outer-training group, three stratified inner speaker folds evaluate every candidate. Each inner model fits only its training people, predicts its validation recordings, and averages those probabilities to speakers before AUROC is calculated. The average of the three validation AUROCs chooses the setting. The selected model is then fitted again from scratch on all outer-training people. The outer test group never chooses the classifier, hyperparameters or threshold. Unlike PatchTST's single validation holdout, this experiment has three rotating training/validation pairs inside each outer fold. The exact 80 partition CSVs cover both main and native-rate scenarios. Final refit contains all development people, not only an inner training subset.

7 Equal training influence and speaker decisions

Each training class receives equal total weight. Within each class, every person receives equal weight; within a person, every recording receives an equal share. For recording j from person i in class c, raw weight is

$$w_{ij} = 1/(N_c F_i).$$

Weights are rescaled to have mean one. The scaler and classifier receive only current-training rows and weights. Test people never determine these counts. The classifiers operate on complete recording vectors. A person's final score is the equal average of that person's recording probabilities, not a pooled average of every window and not an average of hard class labels.

$$p_i = \frac{1}{F_i} \sum_j f(e_j), \qquad \hat{y}_i = \mathbf{1}[p_i \geq 0.5].$$

The first averaging stage here combines embeddings before the recording classifier; the second combines recording probabilities. It is not identical to averaging PatchTST window probabilities, and the distinction is intentional and recorded. Each person contributes one OOF row, regardless of recording count or duration.

8 The conditional fine-tuning rule

The proposal suggests partial fine-tuning when baseline AUROC is below 0.80. This implementation applies that rule to the selected logistic baseline's mean inner speaker AUROC separately in each outer fold. Pooled outer-test AUROC never chooses whether a model is trained. If triggered, a training-side holdout compares two or four upper layers and learning rates of 10^{-5} or $3 \cdot 10^{-5}$. Binary cross-entropy selects an epoch count, with at most six epochs and patience two. Validation AUROC selects the candidate. The lower encoder stays frozen and deterministic. Training uses at most two windows per recording; evaluation uses all windows. A fresh pretrained model is refitted on all outer-training people for the selected epoch count before testing. 0 of the ten main/native outer folds triggered fine-tuning. No upper-layer model was trained in this experiment. The conditional pipeline reuses the frozen logistic baseline and must not be presented as an independent fourth model. The ten training-side gate values range from 0.9921 to 1.0000.

9 Five operating-point metrics and ranking

F1 compares precision and recall but ignores true negatives. Recall counts detected patients; specificity counts correctly excluded controls. Precision concerns the people called positive in this nearly balanced sample. Accuracy counts all correct decisions. The five are always shown together, in percentages. Precision in this nearly balanced speaker sample is not community-screening positive predictive value. Model scores are not established clinical risk probabilities. AUROC describes ranking across thresholds. Trapezoidal AUPRC integrates the precision–recall curve; average precision uses a different step-weighted definition and is reported separately. Neither selects a new threshold after testing. Fold mean and sample SD describe variation in these five small folds, not a confidence interval for deployment. The experimental sample is 46 people, not 773 independent patients. The proposal's above-85% pooled-F1 target is assessed as an internal numerical target, not clinical validation.

10 Main result: Logistic regression

Fold	People	F1	Recall	Specificity	Precision	Accuracy
0	10	100.00	100.00	100.00	100.00	100.00
1	9	100.00	100.00	100.00	100.00	100.00
2	9	100.00	100.00	100.00	100.00	100.00
3	9	100.00	100.00	100.00	100.00	100.00
4	9	88.89	80.00	100.00	100.00	88.89
Mean/SD	–	97.78 ± 4.97	96.00 ± 8.94	100.00 ± 0.00	100.00 ± 0.00	97.78 ± 4.97
Pooled	46	97.96	96.00	100.00	100.00	97.83

Pooled confusion counts: TP=24, FN=1, TN=21, FP=0.

AUROC=0.9943; trapezoidal AUPRC=0.9956; average precision=0.9957.

The pooled F1 exceeds the proposal's 85% numerical target. Misclassified people: PD_CFAERLEI54F (true label 1, score 0.18830).

11 Main result: Random Forest

Fold	People	F1	Recall	Specificity	Precision	Accuracy
0	10	100.00	100.00	100.00	100.00	100.00
1	9	100.00	100.00	100.00	100.00	100.00
2	9	100.00	100.00	100.00	100.00	100.00
3	9	100.00	100.00	100.00	100.00	100.00
4	9	88.89	80.00	100.00	100.00	88.89
Mean/SD	–	97.78 ± 4.97	96.00 ± 8.94	100.00 ± 0.00	100.00 ± 0.00	97.78 ± 4.97
Pooled	46	97.96	96.00	100.00	100.00	97.83

Pooled confusion counts: TP=24, FN=1, TN=21, FP=0.

AUROC=0.9943; trapezoidal AUPRC=0.9956; average precision=0.9957.

The pooled F1 exceeds the proposal's 85% numerical target. Misclassified people: PD_CFAERLEI54F (true label 1, score 0.33270).

12 Main result: XGBoost

Fold	People	F1	Recall	Specificity	Precision	Accuracy
0	10	100.00	100.00	100.00	100.00	100.00
1	9	100.00	100.00	100.00	100.00	100.00
2	9	100.00	100.00	100.00	100.00	100.00
3	9	100.00	100.00	100.00	100.00	100.00
4	9	80.00	80.00	75.00	80.00	77.78
Mean/SD	–	96.00 ± 8.94	96.00 ± 8.94	95.00 ± 11.18	96.00 ± 8.94	95.56 ± 9.94
Pooled	46	96.00	96.00	95.24	96.00	95.65

Pooled confusion counts: TP=24, FN=1, TN=20, FP=1.

AUROC=0.9848; trapezoidal AUPRC=0.9902; average precision=0.9903.

The pooled F1 exceeds the proposal's 85% numerical target. Misclassified people: EHC_GCIALSDA52F (true label 0, score 0.53230); PD_CFAERLEI54F (true label 1, score 0.28048).

Answer to the matched-classifier question

Random Forest: F1 ties the logistic baseline; AUROC ties the logistic baseline; AUPRC ties the logistic baseline.

XGBoost: F1 is below the logistic baseline; AUROC is below the logistic baseline; AUPRC is below the logistic baseline.

These are descriptive comparisons on the same 46 people, not evidence of a statistically established advantage. A more complex classifier is not automatically an improvement.

The native-rate cohort excludes main-error speaker(s) PD_CFAERLEI54F. Consequently, its perfect score changes the people evaluated as well as the training data; it is not an independent confirmation on the original cohort.

13 Flag exclusion and native-rate retraining

Main OOF without flagged controls

Logistic regression

Fold	People	F1	Recall	Specificity	Precision	Accuracy
Pooled	43	97.96	96.00	100.00	100.00	97.67

Random Forest

Fold	People	F1	Recall	Specificity	Precision	Accuracy
Pooled	43	97.96	96.00	100.00	100.00	97.67

XGBoost

Fold	People	F1	Recall	Specificity	Precision	Accuracy
Pooled	43	97.96	96.00	100.00	100.00	97.67

Native-16-kHz-only retraining

Logistic regression

Fold	People	F1	Recall	Specificity	Precision	Accuracy
Pooled	39	100.00	100.00	100.00	100.00	100.00

Random Forest

Fold	People	F1	Recall	Specificity	Precision	Accuracy
Pooled	39	100.00	100.00	100.00	100.00	100.00

XGBoost

Fold	People	F1	Recall	Specificity	Precision	Accuracy
Pooled	39	100.00	100.00	100.00	100.00	100.00

Flag exclusion changes evaluation people only, not fitted models. Native-rate restriction genuinely retrains all models, but also changes the patient cohort. It is not independent confirmation and does not match microphones, rooms or recruitment conditions.

14 Exact partition sizes

Scenario/fold	Inner train	Validation	Final refit	Test
main/0	24/389	12/192	36/581	10/192
main/1	24/405	13/224	37/629	9/144
main/2	24/400	13/238	37/638	9/135
main/3	24/409	13/222	37/631	9/142
main/4	24/390	13/223	37/613	9/160
native16k/0	19/296	10/157	29/453	10/160
native16k/1	22/341	11/176	33/517	6/96
native16k/2	20/320	10/158	30/478	9/135
native16k/3	21/334	11/169	32/503	7/110
native16k/4	21/327	11/174	32/501	7/112

Entries are people/files. The displayed training/validation pair is inner split 0; splits 1 and 2 are also used for selection and exported separately. Final refit is their common complete development set. No single global validation fold is reused as a shortcut.

15 Statistical view: partition sizes

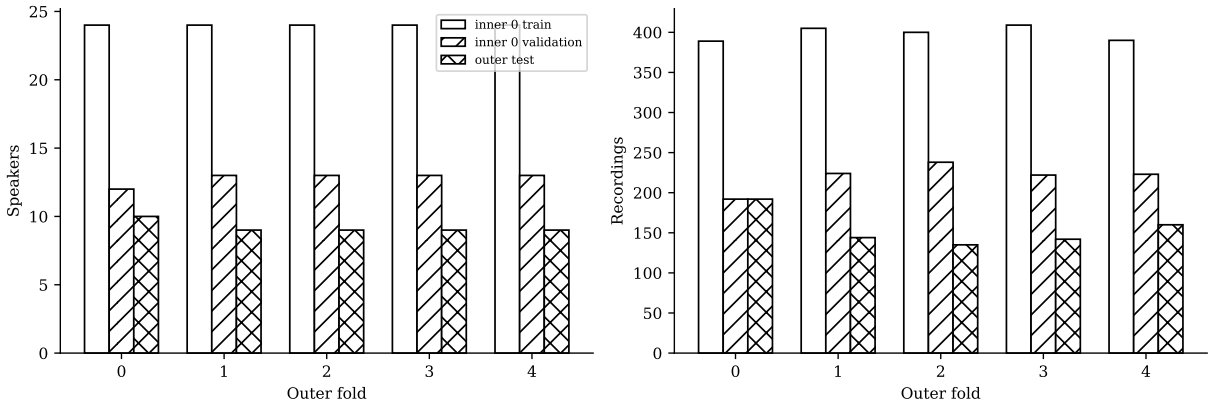

Figure: Main inner split 0 and outer test sizes. Final refit joins inner train and validation. This is a descriptive plot of saved internal records. It does not establish disease-specific mechanisms, calibration or external clinical performance.

16 Statistical view: fold metrics

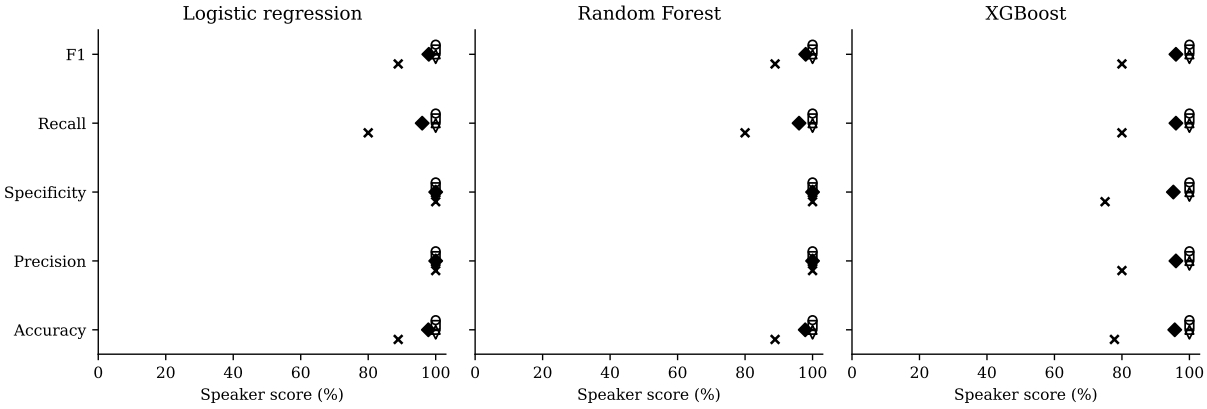

Figure: All five held-out folds and the pooled diamond, for all three matched classifiers. No best fold is selected. This is a descriptive plot of saved internal records. It does not establish disease-specific mechanisms, calibration or external clinical performance.

17 Statistical view: score distributions

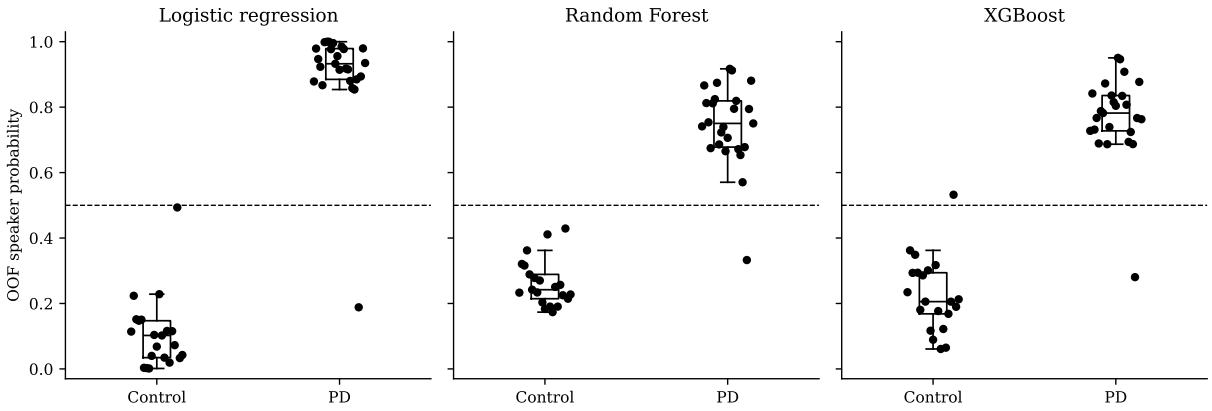

Figure: Every main OOF person and score distribution. The dashed line is the unchanged threshold 0.5. This is a descriptive plot of saved internal records. It does not establish disease-specific mechanisms, calibration or external clinical performance.

18 Statistical view: ranking curves

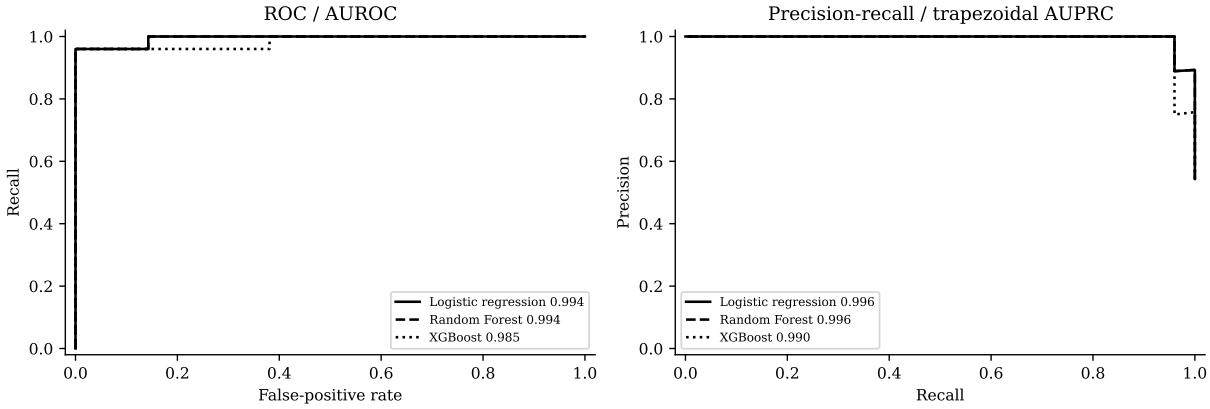

Figure: Pooled ROC and precision–recall curves. AUPRC is trapezoidal; average precision is named separately. This is a descriptive plot of saved internal records. It does not establish disease-specific mechanisms, calibration or external clinical performance.

19 Statistical view: selection curves

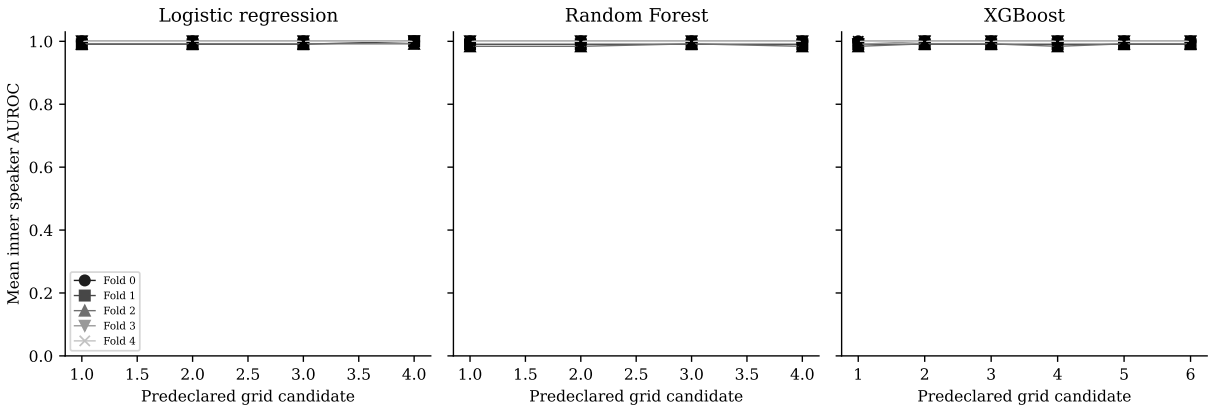

Figure: Training-side grid results only. Grid candidate IDs and exact selected parameters are saved in selection records. This is a descriptive plot of saved internal records. It does not establish disease-specific mechanisms, calibration or external clinical performance.

20 Statistical view: recording burden

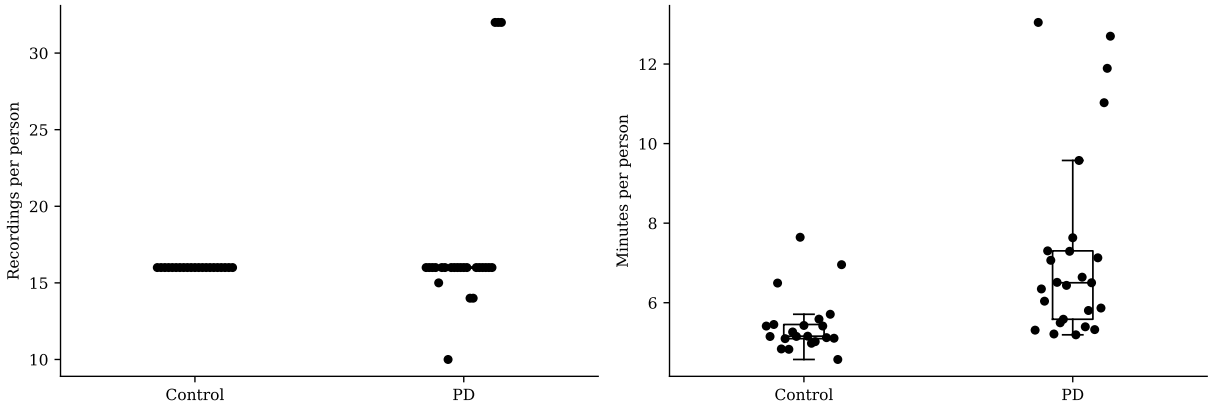

Figure: Number and duration of recordings per person. More recordings do not create more independent participants. This is a descriptive plot of saved internal records. It does not establish disease-specific mechanisms, calibration or external clinical performance.

21 Leakage checks, provenance and remaining limits

The saved-model replay recomputes all thirty frozen-classifier test predictions, checks their pooled source, and recomputes training-side candidate selection. It checks outer/inner identities, weighted training rows and logistic-scaler means. All raw input hashes are rechecked. The predeclared first path at each native sample rate is freshly re-embedded as a limited feature-reproduction check. This is not a full fresh reproduction of all model training or all 773 embeddings. All 30 saved classifier replays passed; 773 raw-file hashes matched. Conditional gates and their actual prediction branches were also replayed. The initial v4.0 check marked nine logistic scaler fits inconsistent because its expected mean used the original float64 weights. The installed scikit-learn first casts weights to the float32 input dtype, then accumulates in float64. Follow-up audit v4.0-audit.1 reconstructs that operation within the unchanged 10^{-10} scaler-check tolerances and replays all thirty saved models again. Every check passes. Models, predictions, selected settings and extracted features were not changed. The original failed `replay_checks.json` remains preserved; `status.json` points to the separately saved resolution and corrected replay. Speaker separation controls known repeat-session overlap. It does not make recording conditions identical. The prior v2.0 audits found class-separated recording dates and predictive static/low-energy acoustic cues. Standard WavLM normalization does not prove that microphone, room or other cohort cues disappear. Earlier development used the same people and results; a revised run does not erase that adaptation. External clinical generalization remains unverified. The appropriate description is speaker-disjoint and leakage-checked, not unconditionally leakage-free. The external benchmark remains deferred.

22 Reproduction and the relation to the proposal

The proposal's WavLM representation and three classifiers are implemented. The report's corrected elderly-only cohort, canonical identities and exact folds replace the proposal's nominal 65-person description. A training-side gate replaces the proposal's potentially test-dependent fine-tuning trigger. Explicit grid loops replace GridSearchCV/Optuna wrappers; their validation results are saved in full. Whisper and handcrafted acoustic models already exist in v2.0 but use different tasks. Their historical scores are not presented as new matched WavLM comparisons. This experiment does not update the official PatchTST result or claim new architecture novelty. Task-specific recording error counts are supplied in `generated/task_error_debug.csv`. They are debug observations, not independent speaker trials or headline accuracy. Frozen run: `artifacts/runs/20261014T191654Z_v4.0_eb438e63b942`. Code and commands: `experiments/v4_0_wavlm_classifiers/README.md`. The run contains settings, source snapshots, input fingerprints, exact split files, all candidate validation scores, selected settings, fresh refitted models, weighted fit rows, recording and speaker predictions, pooled metrics, fold variation and conditional-branch decisions. No training occurs when this document is rebuilt.

B Every exact recording and all five fold roles

T = inner training, V = validation, E = outer test. Each three-character entry lists the roles in inner splits 0/1/2 for that outer fold. For example, VTT means validation in inner split 0 and training in inner splits 1 and 2. EEE means outer test and exclusion from every inner split. Final refit includes every T/V person. Every file is EEE exactly once. The native-rate scenario retains only the rows marked with an asterisk; its separately exported inner splits may differ.
